editionQ: What is the  
difference between `int =  
Object`; and `int = (System  
.Object)Int32.MaxValue`; I  
stumbled across the  
following code that

---

assigns int to the value of Object, so what is the difference between: `int a = Object;` `int a = (System.Object)Int32.MaxValue;` Given the fact that the first assignment is more readable, is it preferred? A: For one you need to use the first one if the assignment is within an if statement, or in a case statement, or even a

---

switch statement. The syntax will be if (typeof(int) != typeof(object)) { int a = (System.Object)Int32.MaxValue; } and switch(a) { case (System.Object)Int32.MaxValue: //Case went here break; } That being said, it would be better to use that as a fallback (I think that is what you are doing). The reason is that

---

in case ([msdn.microsoft.com/en-us/library/27k3tech.aspx](https://msdn.microsoft.com/en-us/library/27k3tech.aspx)): If an int is implicitly converted to a System.Object, any object reference contained in the object is initialized to the default value of the target type of the conversion. This means that if you use your second snippet you run the risk of someone

---

making a typo and assigning a value to a which will then allow your logic to go awry. Using the first snippet, you prevent this by binding a to the System.Object reference. Anatoliy Kozhemyako (ice hockey) Anatoliy Volodymyrovych Kozhemyako (; born June 12, 1986) is a professional Ukrainian ice

---

hockey player. Playing  
career On May 5, 2013,  
Kozhemyako played his  
first match with an  
Olympic quota for  
Ukraine. Career statistics
